2 April 2003

## **Come experience the future at Copenhagen Airport**

**Wonders of the future are in the spotlight at the “Future & Technology” exhibition at Copenhagen Airport from 2 April to 5 May. A result of a collaboration between businesses, research centres, institutions of education and the airport, the exhibition provides an exciting look at new inventions that will shape our future.**

Soon, nano-robots can be used to penetrate our bodies, moving through our bloodstream and attacking cancer cells or transporting insulin. Firefighters will be wearing intelligent suits that tell them when to replace their oxygen bottles or when to get out of a burning building because their pulse is too high. Teenagers of the future will wish for a Moodplayer that can change the music they are listening to, depending on the mood they are in. Disabled persons can be rehabilitated by way of video games. When you walk on the street, computers will be able to recognise your face. And why should ill people have to stay in the hospital, if they can be monitored or even treated at home thanks to advanced software?

All this and more awaits travellers at the interactive exhibition “Future & Technology” in the transit hall until 5 May.
